Forestry, University of Georgia; plant material prepared at the
University of Florida; sequencing done in the Laboratory for
Genomics and Bioinformatics, University of Georgia. Sequence ends
have been trimmed to exclude vector and regions below Phred quality
16. Three-prime sequences are presented as their reverse complement
and have been trimmed to exclude polyA.
Seq primer: JENREV (CAGGAAACAGCTATGACC).

If you are interested in getting corresponding physical clones,
these are publicly available from ZmDB and may be found by BLAST
searching at MSL, maizemap.org; ZmDB, www.zmdD.inataeta.edu. TIGR,
www.igr.org; or NUSBI, www.ncbl.nlm.nlm.gov. When the source of the
maize CDNA sequences is either Virginia Walbot, Stanford or Pat
Schnable, Takte, then clones may be requested from ZmDB:

EMA: Prepared and library constructed by W. Walter Lorenz, School of
Forestry, University of Georgia; plant material prepared at the
University of Florida; sequencing done in the Laboratory for
Genomics and Bioinformatics, University of Georgia. Sequence ends
have been trimmed to exclude vector and regions below Phred quality
and have been trimmed to exclude polyA.
Seq primer: JENERRY (CAGGAAACACTATGACC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /db_xrefe="taxon:3352"

/note="Vector: pSL1180; Site 1: EcoRI; Site 2: XhoI; The library was prepared from poly4+ RNA from drought-stressed loblolly pine (Pinus taeda) roots. Water was withheld from ramet clones until predawn needle water potential reached -1.75 MPa. On day 7 roots were harvested for RNA isolation. Double-stranded cDNA was cloned unidirectionally into pSL1180. Inserts excised with EcoRI (5' end) and XhoI (3' end)."

RNA prepared and library constructed by W. Walter Lorenz, School of
Forestry, University of Georgia; plant material prepared at the
University of Florida; sequencing done in the Laboratory for
Genomics and Bioinformatics, University of Georgia. Sequence ends
have been trimmed to exclude vector and regions below Phred quality
16. Three-prime sequences are presented as their reverse complement
and have been trimmed to exclude polyA.
Seq primer: JENREY (CAGGAAACAGCTATGACC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1208 ATGATGTCTGGCTGGGGAAGACTGTGTATAAGATGCTATATGTGAGCAACGAAAAATATT 1267

RNA prepared and library constructed by W. Walter Lorenz, School of
Forestry, University of Georgia; plant material prepared at the
University of Florida; sequencing done in the Laboratory for
Genomics and Bioinformatics, University of Georgia. Sequence ends
have been trimmed to exclude vector and regions below Phred quality
16. Three-prime sequences are presented as their reverse complement
and have been trimmed to exclude polyA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1929 CACCAAGACTTACCAGGCCGAGAGAAACCGTGGTGAATTGGTTTCCAGCGTACAGTGCTA 1988

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Email: mmpratt@uga.edu

RNA prepared and library constructed by W. Walter Lorenz, School of

Forestry, University of Georgia; plant material prepared at the

University of Florida; sequencing done in the Laboratory for

Genomics and Bioinformatics, University of Georgia. Sequence ends

have been trimmed to exclude vector and regions below Phred quality

16. Three-prime sequences are presented as their reverse complement

and have been trimmed to exclude polyA.

Seq primer: JENREV (CAGGAAACAGCTATGACC).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /clone=RTWW3 5 A06 A022"
/lab_host="DHIOB-TI phage-resistant E. coli"
/clone_lib="Well-watered loblolly pine roots WW3"
/note="Vector: pSil180; Site_1: EcoRI; Site_2: XhoI; The
library was prepared from polyA+ RNA from loblolly pine
(Pinus taeda) roots watered to pot capacity every other
day. Pre-dawn water potential remained -0.3 MPa +/-0.1.
Roots were harvested for RNA isolation. Double-stranded
cDNA was cloned unidirectionally into pSil180. Inserts
excised with EcoRI (5' end) and XhoI (3' end).

plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 KD were directionally choned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"

New purified and isolated nucleic acid sequence encoding a levopimaradiene synthase useful for producing pure ginkgolides in cells. Claim 20; Fig 4; 37pp; English. The invention relates to a purified and isolated nucleic acid sequence encoding a levopimaradiene synthase. The nucleic acid is used for the preparation of a ginkgolide in a cell, an expression vector, a unicellular organism (e.g. Saccharomyces, Escherichia coli, Candida albicans or Kluyeromyces lactis), a yeast host cell, a plant (particularly Ginkgo biloba), a host cell, a transgenic plant or a seed of the transgenic plant, for the biosynthesis of ginkgolides and in molecular biology, molecular genetics, and organic chemistry. The nucleic acid is capable of producing large amounts of pure ginkgolides in a cost-effective manner, particularly in an organism capable of a high-yield sjinkgolide-producing system. This sequence represents a levopimaradiene synthase polypeptide of the invention

S

```
Novel terpene synthase enzymes, useful for producing terpene hydrocarbons, e.g. fragrances or antitumor agents, are derived from known enzymes by specific amino acid alterations.

```
The present invention describes an isolated terpene synthase (I)

C comprising a region with at least 20% identity to region 265-535 of a 548

C comprising a region with at least 20% identity to region 265-535 of a 548

C carbon atoms (alphac) that have interatomic distances, between each carbon atoms (alphac) that have interatomic distances, between each cother, within tabulated ranges, have a centre point (within a sphere of radius 2.3 Angstrom ) within tabulated arange, and have an ordered carangement of R groups (defining as side chains), excluding specific tabulated arrangements (tables given in the specification). (I), and tabulated arrangements (tables given in the specification). (I), and constituted arrangements (tables given in the specification). (I), and constituted arrangements defensive agents, pigments, as fragrances, consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transduction pathways, precursors of steroid consponents of signal transducts and as co-factor side chains.

C components of signal transduction pathways, for muclesic formed by encoding them) are used as controls in memological reagents or nucleic acide for conjunction pathways, and as co-factor side for molicoring expression of terpene synthases or inheritance of the gene in products. AAA3810 to AAA3893 and AAV90831 to AAV90859 represent products.

C sequences used in the exemplification of the present invention

The present invention describes the heterologous expression of taxane analogues, comprising a DNA sequence comprising a taxane synthesis pathway, making a DNA construct in which the DNA sequence is under control of regulatory elements, introducing the DNA sequence is a host cell, growing the host cell to produce taxane analogues, and recovering the required taxane from the culture medium. Also described: (1) an isolated DNA sequence comprising the taxane synthesis pathway, the isolated DNA sequence; and (3) a host cell comprising the isolated DNA sequence; and (3) a host cell comprising a taxane synthesis pathway derived from a taxane-producing organism, plant or tree, the taxane synthesis pathway is foreign to the host cell. The taxane analogues have cytostatic activity, and so can be used as anticancer agents. The present sequence represents a taxadiene synthase homologues protein, which is given in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LKTPRDENGEFFCFLGGTGRGVTDMLNVNRCSHVSFPGETIMEEAKLCTERYLRNALENV 484

The invention relates to a purified and isolated nucleic acid sequence encoding a levopimaradiene synthase. The nucleic acid is used for the preparation of a ginkgolide in a cell, an expression vector, a unicellular organism (e.g. Saccharomyces, Escherichia coli, Candida albicans or Kluyeromyces lactis), a yeast host cell, a plant (particularly dinkgo biloba), a host cell, a transgenic plant or a seec of the transgenic plant, for the biosynthesis of ginkgolides and in of the transgenic plant, for the biosynthesis of ginkgolides and in acid is capable of producing large amounts of pure ginkgolides in a costeffective manner, particularly in an organism capable of a highlyield ginkgolide-producing system. This sequence represents an abietaddene synthase polypeptide which shows similarity to the levopimaradiene synthase of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KSLGLDLPYHLPPISQIHQKRQKKLQKIPLNVLHNHQTALLYSLEGLQDVVDWQEITNLQ 180

Nucleotide sequences encoding mycrene synthase, limonene synthase and pinene synthase from Grand fir may be incorporated into any organism (e.g. intact plant, animal, microbe), or derived cell-culture that produces geranyl diphosphate for the production of the aforementioned enzymes or their products. The sequences when expressed in transfected cells may also be used for the production or modification of flavour and aroma properties, improvement of defense capability, and the alteration of other ecological interactions mediated by mycrene, limonene, pinene, of other ecological interactions mediated by mycrene, limonene, pinene, of other ecological interactions of oil or meal. CDNAs encoding myrcene synthase, pinene synthase and limonene synthase from Grand Fir were isolated and sequenced by the following procedure. Based on comparison of sequences of different plant synthase enzymes, four conserved sequences were identified for construction of four degenerate primers (AAX08646 and AAX08648 and AAX08648) was an antisense primer and used for PCR with the other three sense primers only a combination of primers AAX08648 and AAX08649 generated a PCR product which was 110 base pairs in length. The amplified product was used in a plasmid construct to transform E.coll XII-Blue cells and the inserts were sequenced. Four probes (AAX08650-53) were devised from the sequenced insert and were used to screen a Grand Fir cDNA library. One of these clones is the myrcene appropriate in AAX08649. The other clones identified are Example 1; Page 90-92; 121pp; English. described in AAX08654-56

Claim 108; Page 418-420; 450pp; English.

The present invention describes an isolated terpene synthase (1)

comprising a region with at least 20% identity to region 265-535 of a 548

amino acid (aa) sequence (1a), given in AAY90811. (1) contains nine alpha
carbon atoms (alphaC) that have interatomic distances, between each
other, within tabulated ranges, have a centre point (within a sphere of
radius 2.3 Angstrom) within tabulated ranges, and have an ordered
arrangement of R groups (defining as side chains), excluding specific
tabulated arrangements (tables given in the specification). (1), and
cable arrangements (tables given in the specification). (1), and
capture, acylic, optionally hydroxylated), useful e.g. as fragrances,
clated enzymes, are used to produce a wide range of terpenoids (e.g.
cyclic, acylic, optionally hydroxylated), useful e.g. as fragrances,
components of signal transduction pathways, precursors of steroid
components of signal transduction pathways, precursors of steroid
components of signal transduction pathways, precursors as dide chains.
Some synthases with little or no catalytic activity (and nucleic acids
encoding them) are used as controls in the analysis of products formed by
enzymatic synthesis; as nutrient supplements; for affinity purification

fir abietadiene synthase protein fragment SEQ ID NO:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides the protein and coding sequences of monoterpene synthases from the grand fir. These include (-)-camphene synthase, (-)-beta-phellandrene synthase, terpinolene synthase, (-)-limonene((-)-alpha-pinene synthase, limonene synthase, wyrcene synthase and pinene synthase. The sequences can be used to produce transgenic plants expressing high levels of the enzymes, resulting in levels which are useful in protecting against and treating cancers, and to confer insect resistance on plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LELAKLDFNMVQALHQKETQHIVSWWRESGFNDLTFTRQRPVEMYFSVAVSMFEPEFAAC

The present invention describes the heterologous expression of taxane analogues, comprising cloning a DNA sequence comprising a taxane spithesis pathway, making a DNA construct in which the DNA sequence is under control of regulatory elements, introducing the DNA construct into a host cell, growing the host cell to produce taxane analogues, and recovering the required taxane from the culture medium. Also described:

(1) an isolated DNA sequence comprising the taxane synthesis pathway, (preferably taxol synthesis pathway); (2) an expression vector comprising the isolated DNA sequence, and (3) a host cell comprising a taxane synthesis pathway derived from a taxane-producing organism, plant or tree, the taxane synthesis pathway is forcign to the host cell. The taxane analogues have cytostatic activity, and so can be used as anticancer agents. The present sequence represents a taxadiene synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    595

It contains conservative amino acid substitutions relative to the native sequence (see AAX87504). Each abit of substitutions relative to contains capable of generating multiple sequiterpenes, conditionable enzyme capable of generating multiple sequiterpenes, conditionable enzyme sequiterpene synthase independent of provides gymnosperm sequiterpene synthase in a proteins, as well as expression vectors, and a method of imparting or contained production of a gymnosperm sequiterpene synthase in a combinant convexivotic or eukaryotic host cell, especially in a plant, in order to impart, enhance or modify production of sesquiterpenoids, and hence to alter the flavour or fragrance of plant products, to improve disease content and its derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IDRYPKKEIKESLDYVYRYWDARRGVGWARCNPIPDVDDTAMGLRILRLHGYNVSSDVLE 302
